Introduction

Welcome to version 4 of the Association of Business School (ABS) Academic Journal Quality Guide. The ABS Academic Journal Quality Guide is a hybrid based partly upon peer review, partly upon statistical information relating to citation, and partly upon editorial judgements following from the detailed evaluation of many hundreds of publications over a long period. It provides a guide to the range, subject matter and relative quality of journals in which business and management academics might publish the results of their research.

The brief agreed between the editorial team and the chair of the ABS Research Committee can be summarised as follows:

- I. The Guide should be designed primarily to serve the needs of the UK business and management research community.
- II. The Guide should classify journals into four categories (grades 1 to 4) plus a new category of 4* which recognises the quality of those journals ranked as a 'top' class journal in at least seven of ten international listings consulted.
- III. The classification process should be stringent and methodical in all cases, embracing five sources of evidence:
 - a. the assessments of leading UK researchers in each of the main sub-fields covered
 - b. the mean citation impact scores for the most recent five year period
 - c. evaluation by the editors of the quality standards, track records, contents and processes of each journal included in the Guide
 - d. the number of times the journal was cited as a top journal in ten lists taken to be representative of the 'world' rating business and management journals
 - e. the number of times a journal was cited in the submissions to the 2008 RAE
- IV. The Guide should be comprehensive in the coverage of research conducted in Business Schools in the UK and internationally covering a wide range of disciplines, fields and sub-fields within the social sciences and taking an inclusive approach to what constitutes business and management research.
- V. The editors should accept responsibility for the final classification of all journals included in Version 4 of the Guide, following full consideration of feedback on Version 3 of the Guide and the recommendations made by a panel of experts representing the main sub-disciplines within the field.
- VI. The editors should publish and justify their working methods and their approach to the problems of classification.

This introduction provides important background information which will help you to get more from the ABS Guide. In particular it provides answers to seven frequently asked questions. First, what purposes do academic journals serve? Second, what are the functions of journal quality lists? Third, how do journal quality lists vary? Fourth, what are the problems associated with journal quality lists. Fifth, how have the ABS journal quality rankings been made? Sixth, how do the ABS quality rankings compare with those of others? Finally, why does it all matter?

1. *What Purposes do Academic Journals Serve?*

Academic journals are one of the most important means of publishing and disseminating the results of academic research and scholarship. In doing so, they serve the following purposes:

- I. A stamp of quality. Publication in a journal should indicate that an article can be read and is worth reading. The editorial review processes of all journals in the ABS Guide involve blind peer review of articles submitted by two or more researchers active in the field. These reviewers provide feedback to the authors about the quality and standing of their work. This review process is generally designed to be both developmental and judgemental in nature. Thus authors are advised about whether their articles are publishable in their current form, how they should be revised, whether they should be submitted to another publication, or whether they should not be published at all.
- II. To inform and debate. Most journals are produced by members of the research community in partnership with academic publishers and/or professional associations. The papers selected for publications are intended to disseminate research findings, both empirical and theoretical, and to stimulate debate about particular topics and issues. Improved access to journals by electronic means has meant that debates more frequently take place across journals rather than within the pages of a single journal.
- III. An official record of knowledge and information. The editorial and publishing process produces definitive paper and electronic records which can be indexed and catalogued for a wide range of users – researchers, government, public bodies, corporate bodies, charities, tutors, students, practitioners and members of the public.
- IV. A means of managing intellectual property rights and permissions. The final submission of an article approved for publication is normally accompanied by the signing over of some elements of the author's rights to the article. Once these rights have been assigned, the publisher, the author's agent or in a few cases the author(s) themselves are responsible for granting permissions to reproduce sections of the paper and for the collection of copyright and licence fees.

2. *What are the Functions of Journal Quality Lists?*

Journal quality lists can fulfil one or more of the following four functions.

- I. Provide an indication of where best to publish. This is particularly important for early career researchers or for researchers transferring between disciplines/sub-fields or embarking on cross- or inter-disciplinary research. A list of journals and their relative quality can help potential authors to decide what to read and where to publish.
- II. Inform staffing decisions. In the USA, journal quality lists often inform the decision making processes of tenure, promotion and reward committees. In the UK, they are increasingly used by appointment, promotion and reward committees.
- III. Inform library purchasing decisions. A growing number of higher education institutions and their purchasing consortia are using journal quality lists to determine which journals and aggregation services to buy.
- IV. Application in reviews and audits. Lists are frequently used in the UK and other countries to aid internal and external reviews of research activity and the evaluation of research outputs.

3. *Types of Journal Quality List*

Journal quality lists come in five basic forms:

- I. Institutional lists. These are the most common form of list and are typically drawn up on the basis of the views of members of research groups within a department (e.g. Aston 2008 and Cranfield 2009).
- II. Derived lists. These lists extrapolate journal rankings from the ratings awarded in assessment or audit activities such as the UK RAE (e.g. Easton and Easton, 2003; Geary, Marriot and Rowlinson, 2004; Mingers, Watson and Scaparra, 2009).

- III. Peer surveys. Assessments are made on the basis of the assessments of peers within a particular field or sub-field (e.g.; Jones, Bran and Pendlebury, 1996; Jarley, Chandler and Faulk, 1998; Van Fleet, McWilliams and Seigel, 2000; Peters, Daniels, Hodgkinson and Haslam, 2009).
- IV. Citation studies. In these lists, judgments are made on the basis of the number of times in which an average article in a journal is cited by the authors of articles in related journals (e.g.; Johnson and Podsakoff, 1994; Tahai and Meyer, 1999; Starbuck, 2002 and Institute of Scientific Information, 2004; Madhi, D'Este and Neely, 2009).
- V. Hybrid lists. These lists rank journals by a combination of two or more of the methods listed above (c.f. Wil-Harzing, 2008; Harvey-Morris, 2005).

4. **Commonly Perceived Problems of Journal Quality Lists**

The most commonly perceived problems of compiling journal quality lists are:

- I. Wheat and chaff. One of the most commonly voiced criticisms of journal quality lists is that highly rated journals occasionally publish poor pieces of work and that high quality research sometimes finds its way into lesser ranked journals. There may be some truth in this, but neither situation is commonplace, and journals that consistently publish high quality research invariably rise up the quality rankings; equally, when editorial standards lapse, journals move downward in terms of both citation and quality rankings.
- II. Special issues. It has been suggested that the normal editorial standards of otherwise highly ranked journals may be reduced through the publication of special issues. Practice varies between journals, but all the evidence points to the higher rated journals (3 and 4 in the ABS Guide) maintaining editorial standards across all editions, including special issues.
- III. New journals. Lists tend to give the highest rankings to journals with an established readership and as a consequence tend to rank newer journals, whatever their aspirations or intrinsic quality, lower down the scale. This may be the case, but the process of new journals proving themselves is a necessary one that leads ultimately to quality improvements across the board. Reputation ultimately can only be established through the quality of the articles published.
- IV. Citation Impact Factors are sufficient to measure journal quality. Citation Impact Factors do provide a standardised measure of the extent to which the articles published in a journal are referenced elsewhere, but as a standalone proxy measure of relative journal quality or performance in research (Mahdi et al., 2008) citation impact factors are problematical, as demonstrated in Table 1 below.

Table 1: Limitations of Citation Impact Factors as a Measure of Journal Quality

Limitation	Explanation and Consequences
Incomplete coverage	Some 459 journals out of 821 in the 2010 ABS Guide have a citation impact factor for 2008 (the year for which the most recent data is available) and only 429 have a five year mean citation factor. However, journals without a citation impact factor are regularly cited and some are heavily cited. When, for example, established journals with high peer esteem first enter the scheme they tend to be listed straight away near top of the rankings for their respective field. Examples include the award of an impact factor of 1.537 to <i>Entrepreneurship Theory and Practice</i> on its first appearance in the citation listings in 2005, placing it on a par with titles such as the <i>Journal of Management</i> (1.535) and ahead of the <i>Harvard Business Review</i> (1.404). Even more emphatically, the <i>Journal of Economic Geography</i> came top of the geography list on its first appearance in 2004 with an impact factor of 3.139.
Non-recognition of differences in epistemological traditions	High citation impact factors result from the repeated inclusion of articles in <i>referential chains</i> . A referential chain is a list of references to a series of studies of a similar type that grows ever longer as more studies of that type are conducted. In the experimental sciences, for example, it is commonplace to report on experiments that are variants of earlier studies, and for these earlier studies to be

	included in a referential chain. It is for this reason that psychology journals typically have much higher citation impact factors than journals in other fields included in the ABS Guide. Other disciplines, however, proceed to generate new knowledge through very different practices and procedures. In business and economic history, for example, where most articles are founded on archival data, very few studies are conducted that lead naturally to referential chaining. Hence lengthy chains are rarely formed, and citation impact factors are typically much lower than in the medical, engineering and scientific fields. The long established and highly esteemed <i>Journal of Economic History</i> , for example, known for the originality, rigour and academic quality of its content, recorded a five year average citation impact factor of just 0.73 2008. It follows that citation impact factors should not be used to make comparisons between fields without the application of standardization for differences in centrality and dispersion (as detailed, for example, in Figure 1 below).
Herding	Herding is a consequence of symbolic association. It stems from the tendency of academics to associate their own research through citation to what are perceived to be the best journals and most influential authors. When referential chains are cross-referenced, referential networks are formed such that similar sets of highly cited journals regularly feature in lists of references. This, in effect, places journals already at the top at a big advantage to those seeking to rise through the citation ranks, reinforcing the perception that research published in more highly cited journals invariably is superior to work published in less heavily cited journals. Herding works to mask the fact that top quality research can from time to time be published in less heavily cited journals.
Content bias	Journals devoted to survey articles, literature reviews, methodology and conceptual development tend to be more heavily cited than journals dedicated to publishing the results of original research. Prominent examples in the ABS Guide include the <i>Annual Review of Psychology</i> , with a five year average impact factor of 16.26 in 2008, and the <i>Journal of Economic Literature</i> which in 2008 had an impact factor of 7.842. Journal rankings based purely on citation impact factors cannot distinguish between journals of different types with different academic objectives.
Game playing and differences in levels of maturity between fields	Some academic fields, like economics, have developed more mature and sophisticated academic practices than others. A higher proportion of journals in the field carry citation impact factors when compared to less mature fields like tourism and hospitality management. In mature fields, the rules of the citation game are well known, and there is a well established pecking order of journals, with numerous referential networks in existence. Citation impact factors are a better proxy for journal quality in mature rather than immature fields. In less mature fields, referential networks are far less dense; citation impact factors are fewer and of a lesser order, and consequently a less valuable guide to the reach and influence of journals in the field.

5. ***Compilation and Quality Assessment Procedures***

The ABS Guide provides an expert assessment of the quality of the empirical and theoretical research articles typically published within the pages of an academic journal. The editors take the view that although high quality research may on occasion be published in lesser ranked journals and *vice versa*, these exceptions to the rule do not invalidate the overall assessment of the quality of research published in a journal. The ABS Guide is intended primarily to serve the needs of the UK business and management academic community. However, we know from feedback that the Guide has currency and is used extensively in many countries across the world.

The ABS Guide is essentially a consensus list and its authority rests upon general acceptance of the fair and balanced view of relative quality taken by the editors and advisory panel members. The ABS Guide is not comprehensive. It does not include all the journals in which business and management academics might be drawn to publish their research. Rather, the Guide seeks to include all core

journals, broadly defined, and for established journals evidenced by threshold level inclusion at the latest (2008) comprehensive UK research assessment exercise.

The rankings made in the ABS Guide are not fixed, but have been reviewed annually, and from 2010 onwards biennially in light of available evidence. The ABS Guide is informed by citation statistics but individual journal assessments are not dictated by them. It is observed that citation impact factors vary depending on the scholarly practices prevailing in different fields, the size and nature of the audience for the journal, the types of article published, and the size of the academic community within a field. This means that citation impact factors alone cannot be taken as indicative of the quality of the articles published in a journal. A more sensitive and multi-faceted approach to ranking is required.

Bearing in mind that the overall quality of a journal and the quality of an individual article published therein may vary, upwards or downwards, the journals included in the ABS Guide have been ranked as specified in the following table. This ranking scale is not the same as the RAE scale as it is used to rank journals and not to rate the quality of individual researchers or research outputs. It should be noted that no reference is made to 'national' and 'international' standards, which are seen by the editors as problematic and potentially misleading. In a world of easy communication, research of modest quality is regularly published in journals laying claim to be 'international', and such claims can frequently be supported through reference to the domicile of contributors, readers and members of editorial boards. In the ABS Guide, journals are ranked by the quality and impact of the research typically published without reference to any claims made relating to geographic reach or importance.

Table 2: Specification of Journal Quality Standards

Quality Rating	Meaning of Quality Rating	No. and (%)
4*	World Elite Journals. There are a small number of grade four journals that are recognized worldwide as exemplars of excellence within the business and management field broadly defined and including economics. Their high status is acknowledged by their inclusion as world leading in a number of well regarded international journal quality lists.	22 (2.7%)
4	All journals graded 4, whether included in the world elite or not, publish the most original and best executed research. As top journals in their field, these journals typically have high submission and low acceptance rates. Papers are heavily refereed. Top journals generally have the highest citation impact factors within their field.	72 (8.7%)
3	Three rated journals publish original and well executed research papers and are highly regarded. These journals typically have good submission rates and are very selective in what they publish. Papers are heavily refereed. Highly regarded journals generally have fair to good citation impact factors relative to others in their field, although at present not all journals in this category carry a citation impact factor.	230 (27.9%)
2	Journals in this category publish original research of an acceptable standard. A well regarded journal in its field, papers are fully refereed according to accepted standards and conventions. Well regarded journals have modest citation impact factors or do not have one at all.	295 (35.8%)
1	These journals, in general, publish research of a recognized standard. They are modest standard journals within their field. Papers are refereed relatively lightly according to accepted conventions. Few journals in this category carry a citation impact factor.	204 (24.8%)

In compiling version 4 of the ABS Guide (2010), using the quality classification system outlined above, version 3 of the ABS Guide (2009) served as the starting point. Extensive feedback on version 3 of the Guide was presented to a specially convened advisory panel meeting. The panel met on 5 November 2009 at Warwick Business School and made various general recommendations and many specific recommendations relating to individual titles. The recommendations were then considered by the editors in light of the most recent data including recently published listings and the most recent citation impact data. At this point the editors decided to formulate a more explicit set of principles that would guide decisions to include, exclude and grade journals in version 4 of the Guide. These were agreed as principles at the second meeting of the panel on 5 March 2010 at Manchester Metropolitan Business School. The principles are described below:

1. The ABS Guide 2010 edition includes all journals with 2 or more submissions in the UK Research Exercise 2008 plus a limited number of new journals with the prospect of emerging as a core journal, and in addition selected others with consistently high citation statistics.
2. The journals qualifying for inclusion in the ABS Guide 2010, as detailed in 1 above, were next divided into two sets: those carrying a citation impact factor and those that do not. Each of these sets of journals was then classified according to different procedures.
3. With few exceptions, journals not carrying a citation impact factor were graded at 2 or lower. The exceptions to this rule are journals with an established reputation and previously graded 3 in the Guide. The majority retained this grade in recognition that in particular sub-fields citation impact factors have not been seen as important to journal editors and contributing authors. Examples include the sub-fields of accounting, entrepreneurship and small business, hospitality and tourism; and marketing. (The editors will keep this matter under review as they believe in principle that all higher graded journals – 3 and 4 – should carry a citation impact factor.)
4. Agreed exceptions apart, journals not carrying a citation impact factor were next divided into ranks 1 and 2 on the basis of an individual assessment of (a) evidence relating to the academic standards prevailing at the journal; and (b) the originality and quality of the research articles typically published in the journal. The journals graded as in the 2 category provided convincing evidence of high editorial standards and a thorough refereeing process at the double-blind standard or higher. The journals graded 1 displayed lower standards and a less rigorous refereeing process. Many of the 2 graded journals have editors and members of editorial boards who are respected international authorities within their field.
5. For journals carrying a citation impact factor, the minimum grade awarded is 2.
6. All journals carrying a citation impact factor provisionally were classified as falling within ranks 2, 3 and 4 according to its standardised citation impact factor class. To eliminate known variation in citation practices across the sub-fields of Business and Management, the raw JCR data are measured in terms of field-specific standard deviations from the mean of each field's journal scores. It is computed as follows:
 - a. The field means and standard deviations for each JCR citation impact factor are determined.
 - b. The mean field factor is subtracted from each journal's score and this is divided by the standard deviation for that score for the field. For all journals the standard score measures the number of standard deviations it departs from the mean for the field.
 - c. The scores for all journals were then ranked and divided into quartiles of all journals with an impact factor.
7. The final grade for each journal included in the ABS Guide for 2010 was determined by the editors, under advice from the members of the editorial advisory panel, in two stages.

- a. In the first stage, the provisional classification was either confirmed or moved upwards or downwards based on an individual assessment of (a) evidence relating to the academic standards prevailing at the journal; and (b) the originality and quality of the research articles typically published in the journal. In making these qualitative judgements, editors and advisory panel members, in addition to their first-hand knowledge as subject experts, consulted a specially constructed data set, enabling them to compensate for biases relating to the types of article published within particular journals.
- b. In the second stage, the very highest ranking journals within the 4 category were identified through inclusion of a *superscript. These journals are those ranked in the highest category in at least 7 of 10 business and management journal lists selected to produce an 'international' ranking scale. The 'world elite' rating for each journal counts the number of times a journal is the highest possible rating in each of the following journal quality listings:
 - Financial Times list (2009)
 - University of Queensland (2007)
 - Australian Business Deans Council (2008)
 - Monash University, Melbourne (2007)
 - ESSEC Business School Paris (2005)
 - Centre National de la Recherche Scientifique (2008)
 - Wirtschaftsuniversität Wien (2008)
 - Dutch Business Administration academics (1999)
 - University of Groningen School of Management (undated)
 - University of Texas Dallas (undated)

6. Contents of the ABS 2010 Guide

Grade	ABS 2008	ABS 2009	ABS 2010
4	10.3	10.5	11.4
3	24.9	24.4	27.9
2	37.8	37.4	35.9
1	27.0	27.8	24.8
Total	1017	1033	825

In this section we introduce the reader to the contents of each of the columns contained in the ABS 2010 guide. Following the ISSN and Journal Title columns are those listing the ABS quality ratings awarded to each journal in the previous 2009 edition and in the current 2010 edition. As Table 3 shows the 2010 edition has seen a large number of journals removed from the Guide because they failed to meet the criterion of having at least two submissions in the RAE 2008 BMS unit of assessment. A small number of other journals were also removed because of their marginality to

the core academic concerns of the BMS subject area. As would be expected the reduction of the number of journals to 823 has seen some changes to the proportions of journals represented in each of the four grades of quality, but these differences are not taken to be significant as they are a consequence of the removal of grade 1 journals not meeting the new criteria for inclusion.

Total cites	The total number of citations to be found in RAE 2008 submissions to the Business and Management Studies, Accounting and Finance and Library and Information Studies submissions to RAE 2008.
-------------	---

GPA for outputs	The GPA score for outputs is a summary measure of the RAE 2008 assessment of the quality of an institution's published outputs. GPA is an addition of the weighted proportions of quality as assessed by the RAE BMS panel for 2008. The weights applied to the proportions of output in each quality category were: 4,3,2,1. The mean score for a journal is the mean GPA for outputs awarded to the institutions citing the journal in RAE 2008.
Overall GPA	The GPA score for outputs is a summary measure of the RAE assessment of the quality of an institution's research including scores for published outputs, research environment and esteem. GPA is an addition of the weighted proportions of quality as assessed by the RAE BMS panel for 2008. The weights applied to the proportions of output in each quality category were: 4,3,2,1. The mean score for a journal is the mean GPA for overall quality awarded to the institutions citing the journal in RAE 2008.

Grade	Mean cites in BMS	Mean outputs GPA	Mean Overall GPA
4	24.5	3.5	3.8
3	19.9	2.9	3.2
2	8.7	2.5	2.7
1	5.2	2.2	2.3
Total	12.7	2.6	2.9

Table 5 displays an analysis of the variables taken from the submissions made to the BMS unit of assessment in RAE 2008. It shows first of all, that the most highly rated journals in the ABS 2010 Guide were those more likely to be cited by researchers included in the BMS RAE 2008. Journals rated 4 were nearly five times more likely to be cited than those journals rated 1. Table 5 also reports the mean GPA scores for each ranking. It is to be expected that publications in highly rated journals would be cited more frequently by institutions highly rated by the RAE panel. For all grade 4 journals the institutions citing them were awarded on average a GPA of 3.5, but grade 1 journals were cited by less

well regarded institutions awarded a mean GPA of 2.6. A similar pattern is seen in the mean scores for overall outcomes of the RAE including the environment and esteem ratings.

Citation Impact Factor 2008	The citation impact factor of a journal is the number of current year citations to the source items published in that journal during the previous two years. As described in the text the quoted figures have been standardised by field, and are measured in terms of standard deviations from the mean for the field.
Five Year Mean Citation Impact Factor	The JCR reports 2009 include the five year mean impact factor using data for the years 2004-8. As described in the text the quoted figures have been standardised by field, and are measured in terms of standard deviations from the mean for the field.

The ISI/Thompson 2008 Journal Citation Reports provide report on 460 of the journals included in this version of the guide. Version 4 of the ABS Guide incorporates a two citation impact factor quartile rankings based on the. The two factors reported in the new version 4 of the Guide are: the five year mean citation impact score; and the citation impact factor score for 2008. These are defined in Table 6.

Figure 1: Box plots of the JCR Five Year Mean Citation Impact by Field.

Rather than use the raw scores found in the journal citation reports, the JCR data was standardised by subject area and then these scores divided into quartiles. The latest (2008) citation impact figure are thus expressed as a quartile ranking of journal impact factors standardized by subject-area. Those journals with a score of four are in a class of the top twenty five percent of journals for the citation impact factor reported.

Grade	Impact 2008	Five Year Mean
4	1.1	1.2
3	-0.6	-1.0

While, at present, citation impact factors are not available for all business and management journals, Table 7 shows that those journals with the highest ABS 2009 ranking invariably have the highest citation impact factors: ABS grade 4 journals are typically just over one standard deviation above the mean impact factor for their field whereas those in the 3 category are between half and nearly one standard deviation below the mean of their

fields.

One way of assessing the validity of the ABS scheme is to assess its consistency or reliability in relation to other quality indicators. First, we can examine the schemes produced by other academic British academic institutions. Table 8 displays the percentage of journals classified at each grade for the ABS 2009 Guide and those for other quality indicators.

¹ The field codes used are those listed in the RAE 2008 statement of criteria and working methods, with the addition of ethics and governance, sector studies, and tourism and hospitality. The Law sub-field has with withdrawn from the list and the law journals that meet the guide's classification criteria have now been re-allocated to other sub-fields.

Table 8 Pearson 'r' for the ABS and Other Schemes						
	Kent 2007	Aston 2008	World Elite Count	RAE 2008 Outputs GPA	Impact Factor 2008	Five Year Mean Impact
ABS 2009	.70	.70	.49	.47	.47	.47
ABS 2010	.71	.71	.53	.55	.58	.59

Table 8 confirms that the ABS Guide has a highly consistent pattern of correlation other ranking schemes, RAE 2008 outcomes and citation impact factors. The comparison of 2009 and 2010 journal ranks shows a stronger link between impact factors and journal quality ratings. The validity of the ABS quality guide is also confirmed by a regression analysis where the mean ABS 2010 grade of an institution's journals submitted in RAE 2008 were used to predict RAE 2008 GPA scores (Kelly, Harvey and Morris, 2009).

Table 9 Key to Subject Fields in ABS Journal Quality Guide Tables	
Subject Code	Subjects Covered
ACCOUNT	Accounting. This field includes auditing and taxation journals (See also Finance).
BUS HIST	Business History. This field includes related specialist journals focusing on management, firms, industries and employees.
ECON	Economics. This is a very broad field with many sub-specialisms. The focus in the selection of journals has been on general economics journals and those that publish articles dealing with business, management and industrial economics and related fields.
ENT-SMBUS	Entrepreneurship and Small Business.
ETH-GOV	Ethics and Governance.
FINANCE	Finance. All general and specialist finance journals including insurance and actuarial journals.
GEN MAN	General Management. This is a broad field containing many of the "heartland" journals of business and management studies, which have a broad coverage and inter-disciplinary content.
HRM&EMP	Human Resource Management and Employment Studies. This field includes journals dealing with personnel, human resource management, employee and industrial relations as well as those that apply sociological perspectives to work and employment.
IB&AREA	International Business and Area Studies. This field brings together international business and interdisciplinary area studies.
INNOV	Innovation and technology change management.
INFO MAN	Information Management. Studies of information systems and information technology and information processes.
MGT&ED	Management and Education. This includes career, employee and management development as well as publications focusing on education, skills and training.
MKT	Marketing. The field covers advertising and marketing and related specialisms such as communications and public relations.
ORG STUD	Organization Studies.

PSYCH	Psychology. This is a small sub-set of the psychology journals that attract contributions from business and management academics.
OR&MANSCI	Operations Research and Management Science. This field includes the application of mathematical analysis, operations research,
OPS&TECH	Operations and Technology Management.
PUB SEC	Public sector policy, management and administration
SECTOR	Sector Studies. This covers health, education, arts, not-for-profit, engineering and other fields of management practice. It extends beyond issues of services management to include specialisms in manufacturing and primary industries.
SOCIAL SCIENCES	Social Sciences. These in the main are sociological, geographical, economic historical, cultural and political journals that are attractive publication outlets for business and management academics.
STRAT	Business Strategy.
TOUR-HOSP	Tourism and Hospitality Management.

7. *Why does it all matter?*

Over the past two decades, academic journal publishing has risen from relative obscurity to become a global industry dominated by big international publishing houses. In business and management alone, the major publishers already have tens of academic journals in their “stables”. Academics from many parts of the world have been willing collaborators in this explosion in academic journal publishing. On the demand side, there is a genuine desire for more specialist content to support academic developments in teaching and research. On the supply side, academic careers are increasingly tied to success in publishing, meaning that more and more papers are being turned out in search of a legitimate vehicle for dissemination. English has become the international academic language, and the growth in both demand and supply seems set fair to continue as more academics around the world are drawn into the game.

The fates of individual academics and publishers are intimately bound together. As the number of journal titles has multiplied, the search for distinction and high status by way of citation impact factors and quality rankings has intensified. Authors wish to publish in the “best” journals, such as those in the 4 and 3 grades in the ABS Guide, as publication in these journals confers greater status (and ultimately career) rewards than publication in journals lower down the pecking order. The academic journals market is both hotly contested and highly stratified. The fact is that there are many hundreds of business and management journals in the 2 and 1 grades of the ABS Guide. It follows that for publishers status and reputation are keenly sought after. The more high ranking journals in an “academic stable”, the greater the ultimate financial rewards are likely to be. Certainly, there are other factors bearing upon profitability, but, *ceteris paribus*, it is much better in the long run for publishers to be associated with journals that confer high status upon their contributors. In the competitive struggle, it pays to attract academic editors, members of editorial boards, and contributors of high academic distinction. The fate of the majority of journals may be to languish in the reputational foothills, but a minority, blessed with strong credentials, clever strategies and broad market appeal, will rise quickly through the ranks to become high status, high reputation publications.

Conclusion

The ABS Academic Journal Quality Guide is intended to benefit the ABS membership and the academics who work in member schools. In order to make informed decisions, whether at the level of the business school or at the level of the individual academic, a fair and reasonable guide to the quality of academic journals is an indispensable tool for research strategy making. The data analysis presented in this introduction gives support to those who trust the ABS Guide in making often

otherwise extremely difficult judgements about research quality across a disparate set of sub-fields within the business school community. The ABS Guide, in recognizing the both peer evaluation and citation impact factors as pertinent to any assessment of journal quality, meets the specific needs of those making such decisions.

Appendix 2: Providing feedback to the editors and the advisory panel.

The Association recognizes that journal quality ranking exercise is not a precise science but a process by which judgements are made on the basis of those sources of evidence that are readily available to the editors. The Association of Business Schools therefore invites feedback on version 4 of the ABS Academic Journal Quality Guide from relevant discipline based professional and representative associations, and individual researchers. It is ABS policy that the journal quality guide should be subject to regular review in order to reflect developments in the field. In particular, the Association invites feedback with respect to the following:

- I. Journals that might usefully be included in or excluded from the Guide;
- II. Improvements and ways of adding value to the Guide;
- III. Classification of the journal's field and grade;
- IV. Comments on the methodology of journal quality assessment.

For the previous versions of the Guide, the quality of feedback received has varied enormously. Given the high volume of feedback received by the editors, those providing feedback are strongly advised to take note of, and act in accordance with, the following:

1. Feedback submitted after 1st April 2010 will be taken into account when editors and advisory panel meet in November 2011 to consider changes to the guide to be made for Version 5 (2012).
2. The editors will not consider feedback submitted directly from journal publishers. Publishers should provide editors and associated academic groups with the information relevant to assessment of a journal's quality as defined by the editors in the introduction to the guide.
3. Feedback from groups of academics representing a specialist field carries greater weight than that from individual academics. Feedback will be welcomed from discipline-based professional and representative associations. Individual academics are encouraged to make their opinions felt through the relevant associations.
4. Those providing feedback should read the criteria of journal quality assessment listed in the introduction to the guide. For example, those proposing that a journal be upgraded to a '3' should be aware that this proposal is unlikely to be accepted if the journal does not have an ISI/Thompson impact factor. Journals currently graded '3' that have still failed to secure an impact factor will, in accordance with editorial policy, automatically be considered for downgrading to '2' when Version 5 of the guide is in preparation.
5. Effective feedback will be in the form of evidence and arguments closely linked to the criteria listed in the introduction to the guide.

Please read the introduction to the guide before making any feedback especially those section related to the role of RAE 2008 submissions data and the use made of JCR citation impact factors.

All feedback should be sent by email to Julie Davies, Head of Research and Executive Development at the ABS: JDavies@the-abs.org.uk
